

## 410. Split Array largest sum

### Simple Recursion

lets say  $m = 3$        $\text{len}(\text{arr}) = 10$

say 1<sup>st</sup> split is ~~at~~ after index 1

Subproblem  
arr of size  $10 - 2 = 8$   
 $m = 3 - 1 = 2$

```
def split(indx, nums, m)
```

```
    if m == 1:
```

```
        return sum(nums[indx:])
```

```
    else:
```

```
        for x in range(indx, len(nums)-m+1):
```

```
            thissum = sum(nums[x:])
```

```
            aftersplit = max(thissum,  
                             divide(x+1, nums, m-1))
```

```
            ans = min(ans, aftersplit)
```

```
memo[(indx, m)] = ans
```
